Book Condition: New. Publisher/Verlag: Springer, Berlin | Structure Mechanism, Hormonal Control and its Role in Disease | The sodium of animal cell membranes converts the chemical energy obtained from the hydrolysis of adenosine 5' -triphosphate into a movement of the cations Na^+ and K^+ against an electrochemical gradient. The gradient is used subsequently as an energy source to drive the uptake of metabolic substrates in polar epithelial cells and to use it for purposes of communications in excitable cells. The biological importance of the sodium pump is evident from the fact that between 20-70% of the cell's metabolic energy is consumed for the pumping process. Moreover, the sodium pump is an important biological system involved in regulatory processes like the maintenance of the cell's and organism's water metabolism. It is therefore understandable that special cellular demands are handled better by special isoforms of the sodium pump, that the expression of the sodium pump and their isoforms is regulated by hormones as is the activity of the sodium pump via hormone-regulated protein kinases. Additionally, the sodium pump itself seems to be a receptor for a putative new group of hormones, the endogenous digitalis-like substances, which still have to be defined in most cases in their structure. This group of substances has its chemically well known counterpart in steroids from plant and toad origin which are generally known as "cardiac glycosides". They are in medical use since at least 200 years in medicine in the treatment of heart diseases. | Gene organization, analysis of the sodium pump by molecular biology.- Transcription factors regulating the Na^+/K^+ -ATPase genes.- Expression of functional Na^+/K^+ -ATPase in yeast.- Expression of functional Na^+/K^+ -ATPase in insect cells using baculovirus.- Sp1 and an E-box binding protein regulate Na^+/K^+ -ATPase β -subunit gene.- Cloning and...
